

# Trajectoires individuelles et réseaux spatiaux

## *Du territoire au système complexe*

**Maxime Lenormand**  
UMR TETIS, Irstea, France

**Gestion Optimisée de l'espace:  
des villes aux systèmes naturels**

13-14 décembre 2017 | Lyon, France

# Thèmes & méthodes

- 1 Représentation des systèmes complexes
  - ▶ Comment modéliser/représenter les territoires et ce qui s'y passe ?
  - ▶ De quel(s) territoire(s) parle-t-on ?
- 2 Compréhension/caractérisation des systèmes
- 3 Optimisation des systèmes
  - ▶ Distance à l'optimum - aux optima
  - ▶ Concept de carte des possibles

2. Develop a set of indicators to assess the actual network configuration

4. Measure the impact of change at different scale (particularly at the individual level)

3. (Temporal) network reconfiguration respecting a set of constraints

# Terminologie

- ▶ Statique
- ▶ Individu-centrée
- ▶ Aléatoire - stochasticité
- ▶ Intra/inter - ouvert/fermé
- ▶ Réseau complexe : abstraction  $\leftrightarrow$  données

# Représentation du "réel"

"Réalité"

Modèle(s)

# Reconstruction du "réel"

Echantillonnage

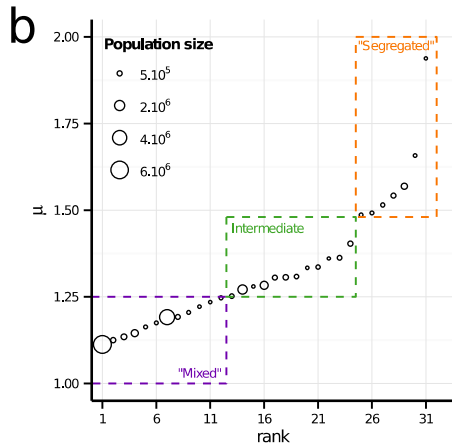

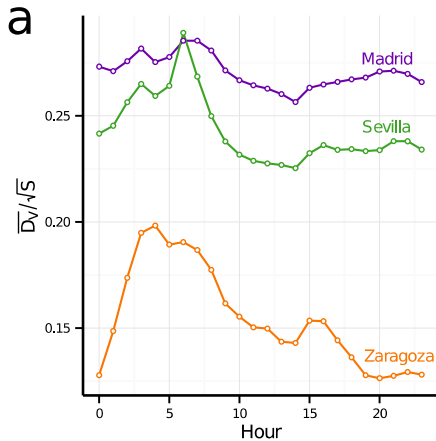

# Structure spatiale

- ▶ 50M d'utilisateurs
- ▶ Métropoles - Espagne
- ▶ Relevés téléphoniques

2. Develop a set of indicators to assess the actual network configuration

4. Measure the impact of change at different scale (particularly at the individual level)

3. (Temporal) network reconfiguration respecting a set of constraints

# Modèles explicatifs

## *Spatial Interaction Models*

$$p_{ij} \sim \frac{O_i D_j}{f(C_{ij})}$$

## *Land Use & Schelling*

2. Develop a set of indicators to assess the actual network configuration

4. Measure the impact of change at different scale (particularly at the individual level)

3. (Temporal) network reconfiguration respecting a set of constraints

# Crowdsourcing the Robin Hood effect in cities

T Louail

Murillo A J

Ramasco JJ

**BBVA**

# Spatial inequality in the city

- ▶ In any city there are some neighborhoods that are significantly poorer than others

- ▶ Strong inequalities have harmful consequences

→ **Neighborhoods effect**

- ▶ Fostering commercial activity may indirectly benefits to the resident population

- Job opportunities;
- More transport;
- Increased safety...

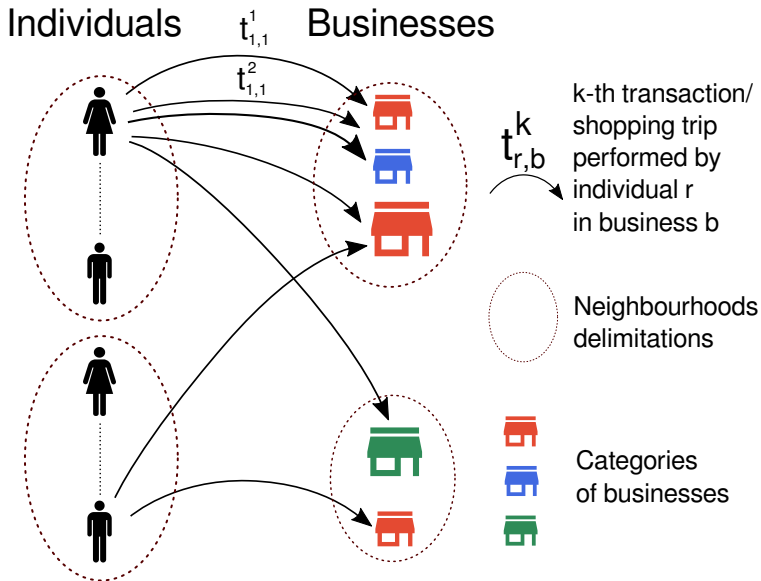

# Redistribution through shopping mobility

- ▶ 15 to 20% of our daily trips are shopping trips
- ▶ They convey money from one part of a city to another
- ▶ **Spatial Robin Hood effect** means taking from the rich neighborhoods to give to the poor neighborhoods

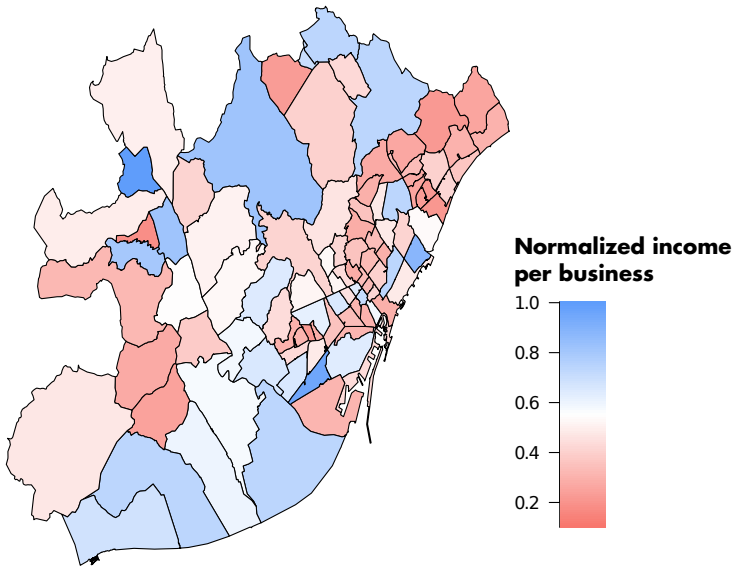

# Bipartite network of shopping trips

# Spatial distribution of business income

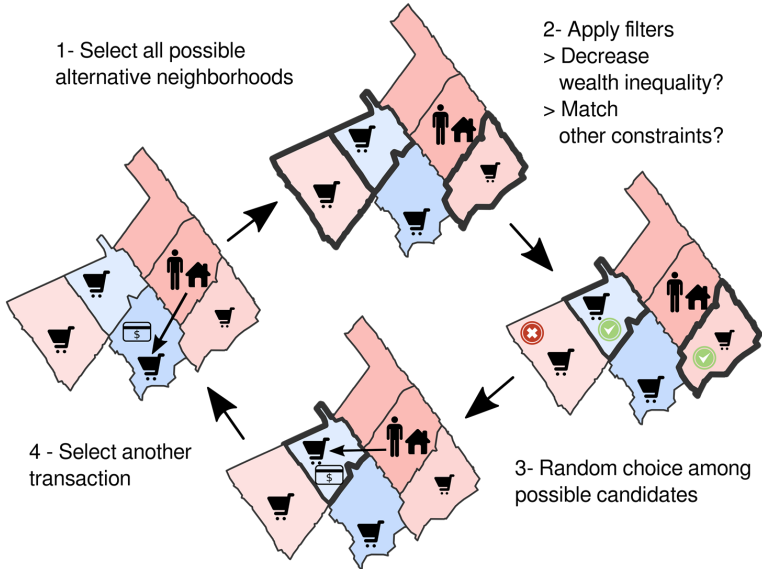

# Rewiring method

1- Select all possible alternative neighborhoods

2- Apply filters  
> Decrease wealth inequality?  
> Match other constraints?

# Three other key aspects

In addition to the spatial distribution of business income and its distance to the egalitarian situation  $\mathbf{W}$ , we also take into consideration:

- ▶ The distance traveled  $\mathbf{D}$
- ▶ The spatial routines of individuals  $\rho$
- ▶ The spatial mixing of individual residing in different part of the city, evaluated as the distance to a "fully mixed city"  $\mathbf{S}$

# Reachability of the solution...

...while preserving the other key aspects

→ **Wealth inequalities  
between neighborhoods  
are reduced by 95%**

# Reachability of the solution...

...while preserving the other key aspects

Many possible rewiring methods, the "clever" methods perform better

# Individual human mobility patterns

# Assessing the cost of change

# Assessing the cost of change

# Multi-criteria improvement of shopping mobility

# Take home messages

- ▶ **Rewiring ~10 % of all individual shopping trips might result in a 80+ % decrease of business income inequality among neighborhoods, in Barcelona and Madrid**
- ▶ Situations where ICT data bypass top-down planning policies and foster distributed, bottom-up approaches of city-scale hard problems
- ▶ Urgent need to relate ICT data to social equity and spatial justice and such apps would rejuvenate the very meaning of the so-called « sharing economy »

2. Develop a set of indicators to assess the actual network configuration

4. Measure the impact of change at different scale (particularly at the individual level)

3. (Temporal) network reconfiguration respecting a set of constraints
